### **Project Details :**

#### **Project Description:**

In this project, our primary goal is to craft a dynamic and user-friendly WordPress blog. We're focused on designing a visually appealing and responsive website that not only showcases compelling content but also provides a seamless user experience. Through theme customization, essential plugin configuration, SEO optimization, and an intuitive content management system, we aim to create a platform for sharing valuable information, engaging with our audience, and effectively establishing an online presence.

1. Searched "WordPress Blog": This is the first step in creating a WordPress blog. You should open your web browser and search for "WordPress Blog" to find the platform's website.
2. Clicked "Create a Blog on WordPress.com": After finding the WordPress website, click on the "Create a Blog on WordPress.com" option. This will take you to the starting point of creating your blog.

3. Clicked "Get Started": Once on the WordPress website, you should click the "Get Started" button. This is where you initiate the process of setting up your blog.
4. Signed up with Google or email: You will be prompted to sign up or create an account. You can choose to sign up using your Google account or by entering your email and creating a password.
5. Clicked "Choose My Domain Later": During the setup, you may be asked to select a domain name for your blog. If you wish to choose it later, select the option to "Choose My Domain Later."
6. Clicked "Start With Free": You may have different plans available, but if you're looking to start your blog for free, select the "Start With Free" option.
7. Clicked "Skip To Dashboard": After setting up your account and blog, you can skip the additional setup steps and go directly to your blog's dashboard where you can start creating content.
8. Clicked "Launch Your Site": To make your blog live on the internet, you need to click the "Launch Your Site" option. This will make your blog publicly accessible.
9. Clicked "Posts": In the dashboard, select the "Posts" option. This is where you can manage and create new blog posts.
10. Clicked "Add New Post": To create a new blog post, click the "Add New Post" button. This is where you will compose and edit your content.
11. Created a blog using AI and pasted it on Grammarly: Use an AI tool to generate the initial content for your blog post. After generating the content, paste it into Grammarly for editing and proofreading.
12. Copied all the contents (title, header, subcontent) from Grammarly to the WordPress post: After editing and proofreading in Grammarly, copy all the text, including the title, header, and subcontent, and paste it into your WordPress blog post.
13. After filling in the content in the post, scrolled down and added Categories, Tags, and Featured Image: Below your blog post content, you can scroll down and add relevant categories and tags to organize your content. You can also set a featured image for your post.

14. After fully editing the post, clicked the "Publish" button: Once you've made all the necessary edits, click the "Publish" button to make your blog post live on your website.

15. I can now see the published blog: After successfully publishing your blog post, you can view it on your WordPress website. Your blog is now accessible to your readers.
